

CLOUD-NATIVE APPLICATION DEVELOPMENT

Cloud-Native Application **Development**

01

- ◆ Design and development of applications specifically for cloud environments

Leveraging cloud-native technologies and principles for scalability, flexibility, and resilience.

Embracing microservices architecture, containers, and serverless computing.

DevOps Practices in Cloud-Native **Environments**

02

- ❖ Automation of infrastructure provisioning and management using tools like Terraform and Ansible
- Continuous integration and continuous delivery (CI/CD) pipelines for rapid application deployment
- Monitoring and observability of cloud-native applications using tools like Prometheus and Grafana

Cloud-Native **Technologies** and Platforms

03

❖ Containerization using Docker and Kubernetes for packaging and managing applications

Serverless computing platforms like AWS Lambda and Azure Functions for event-driven applications

Cloud-native databases like Cassandra and MongoDB for distributed and scalable data storage
